

Software Test Design (STD)

1. Introduction:

Describe the purpose of this test design document and what features are covered.

This Software Test Design (STD) document outlines the functional test cases created for the PAWSitive Life mobile application. The app is designed to provide dog owners with a personalized and supportive environment for raising and managing their dogs, combining practical tools with user-friendly features to improve the overall care experience.

Beyond standard functionality like user registration, login, and personal profile management, the application emphasizes three innovative features:

1 – Daily Reminders and Calendar Integration

Dogs require frequent medical treatments, timely food purchases, and other routine care activities that can easily be forgotten. This feature organizes all pet-related tasks in one place, ensuring nothing important is missed through timely reminders and a clear, accessible calendar.

2 – Interactive Map and Social Layer

This feature combines real-time location services with a social aspect:

It displays nearby dog-related places such as dog parks, veterinarians, and pet stores using Google Maps.

It also allows users to view social data such as which dogs are currently at a park, or which veterinarian treats which dogs—helping dog owners make better-informed decisions based on community input.

3 – Personalized Articles

The app offers dog owners informative content tailored to their dog's characteristics (e.g., breed, age, health history). This helps users discover relevant and useful knowledge, from early training guidance to health precautions like harmful plants for dogs—presented in a simple and accessible way.

The purpose of this document is to validate that each of these features functions as expected under defined conditions. The test cases described will verify correct behavior across all major modules, including backend integration with Firebase and location-based services via Google Maps API. This will help ensure the app delivers a consistent, reliable, and valuable experience for its users.

	Test Case ID	Description	Preconditions	Test Steps	Expected Result	Actual Result
1	TC-001	Add a vaccine reminder for a specific dog	- The user is logged in - The user has at least one existing dog profile - The app has permission to send notifications	1. Open the app 2. Navigate to the "Reminders" section 3. Tap "Add Reminder" 4. Choose a date 5. Select reminder type as "Vaccine" 6. Assign to a specific dog profile 7. Save the reminder	A new vaccine reminder is saved and visible in the reminders list and calendar for the selected dog. Notification will be scheduled accordingly.	A new vaccine reminder is successfully saved and appears in both the reminders list and the calendar for the selected dog. A notification is scheduled accordingly.
1	TC-002	Delete a reminder and confirm removal	- User is logged in - At least one dog profile exists - At least one reminder exists for that dog	1. Open the app 2. Navigate to the "Reminders" section 3. Locate the reminder to be deleted 4. Slide the reminder to left 5. Confirm deletion in the dialog	The reminder is removed from the reminder list and calendar view. No further notifications are scheduled for that reminder.	The reminder is successfully removed from both the reminders list and the calendar view. No further notifications will be triggered for it.
1	TC-003	View calendar with upcoming reminders per dog	- User is logged in - At least one dog profile with reminders exists	1. Open the app 2. Navigate to "Reminders" section 3. select a date	Calendar displays upcoming reminders categorized per dog profile	The calendar displays upcoming reminders, organized by dog profile
1	TC-004	Switch from month calendar view to week calendar view	- User is logged in - The user is on the "Appointments" (Reminders) screen - Calendar is currently in monthly view (default)	1. Open the app 2. Navigate to the "Reminders" via calendar icon in the bottom nav bar 3. Tap the toggle button (arrow icon next to the month name, e.g., June, 2025) 4. Observe that the calendar view changes to weekly view (1 visible row of dates) 5. Tap the toggle button again to switch again to monthly view	Tapping the arrow button toggles between month view (all weeks) and week view (one week), keeping the selected date highlighted and updating the icon accordingly.	Tapping the arrow button switches between month view (showing all weeks) and week view (showing a single week), while maintaining the selected date highlight and updating the icon to match the current view.

2	TC-005	Select and display the user's favorite dog park on the map.	- User is logged in - The app has access to a list of dog parks stored in Firebase - MAPuppy screen is implemented and accessible	1. Open the app 2. Navigate to the MAPuppy screen 3. Tap the "Select Favorite Park" button 4. A popup appears showing a list of available dog parks from Firebase 5. Select a dog park from the list 6. The selected park is saved as the user's favorite 7. The map updates to center on the selected park location 8. The selected park's name is displayed as the favorite in the designated text field	The user is shown a list of dog parks from Firebase. Upon selecting a park, the map centers on that park's location. The park name appears clearly as the user's selected favorite	The functionality works as expected. A popup displays available parks, the selected park is saved and shown on the map, and the name appears correctly. However, the list of available parks in Firebase is limited and should be expanded to improve usability.
2	TC-006	View other users in the selected dog park and send "I'm Coming!" status	- User is logged in - A favorite dog park is selected - At least one dog is registered to the user	1. Open the app 2. Navigate to the "MAPuppy" screen 3. Tap on "I'm Coming!" 4. A popup appears showing the user's dogs 5. Select one or more dogs 6. Tap "Confirm" 7. The selected dogs are added to the visible list of dogs currently in the park	A list of dogs currently marked as present in the selected dog park is displayed, with basic dog info per entry.	The dogs in the park is displayed in a list. The user's dogs are shown in a selection popup. After confirmation, the chosen dogs appear in the list of dogs currently in the park.
2	TC-007	Display a list of veterinarians in the system and assign dogs to the selected vet	- User is logged in - At least one dog profile exists - The app contains a list of veterinarians (from Firebase)	1. Open the app 2. Navigate to the "MAPuppy – My Vet" section 3. Tap the "CHANGE" button 4. A list of available veterinarians is displayed in a popup 5. Select one veterinarian from the list 6. A list of the user's dogs is displayed	A popup window appears with a full list of veterinarians Upon selection, the user's dogs are shown Selected dogs are marked as being treated by the chosen vet. Dogs can later be unassigned from the vet.	A popup window opens upon tapping the "CHANGE" button in the veterinarian section. The popup displays a full list of veterinarians stored in the Firebase. After selecting a veterinarian, a list of the user's dogs appears. The user

				7. Select one or more dogs to assign to the chosen vet 8. Confirm selection 9. Remove a dog from the assigned vet later		selects one or more dogs and confirms the assignment. The selected dogs are now shown as being treated by the chosen veterinarian.
2	TC-008	Change the assigned veterinarian and assign dogs to the new vet	▪ User is logged in ▪ At least one dog profile exists ▪ Veterinarian list is available in Firebase	1. Navigate to the "My Vet" section. 2. Tap the "Change" button. 3. A list of veterinarians appears in a popup. 4. Select a veterinarian. 5. A list of the user's dogs is displayed. 6. Select one or more dogs and confirm. 7. The selected dogs are now marked as assigned to the chosen vet.	A vet list appears from Firebase. After selection, user's dogs can be assigned. The selected dogs appear in the vet's patient list.	The veterinarian list was successfully retrieved from Firebase and displayed in a popup. After selection, the user's dogs were shown correctly. Selected dogs were assigned to the chosen veterinarian and now appear in the relevant vet's patient list as expected.
2	TC-009	Call the assigned veterinarian from the "My Vet" section.	▪ User is logged in ▪ A veterinarian is selected and displayed in the "My Vet" section. ▪ A valid phone number is saved in Firebase for the selected vet	1. Navigate to the "My Vet" section. 2. Tap the "Call Now!" button.	The phone app opens and starts a call to the selected veterinarian's phone number from the database.	Tapping the "Call Now!" button initiated a phone call to the veterinarian's number as saved in Firebase. The system used the correct number and successfully opened the phone app.
2	TC-010	Change the assigned pet store and assign dogs to it.	▪ User is logged in. ▪ At least one dog profile exists. ▪ Pet store list is available in Firebase.	1. Navigate to the "My Pet Store" section. 2. Tap the "Change" button. 3. A list of pet stores appears in a popup. 4. Select a pet store. 5. A list of the user's dogs is displayed. 6. Select one or more dogs and confirm.	A list of pet stores appears. After selection, dogs can be assigned to the chosen store. The store assignment is saved and displayed properly.	A list of pet stores was retrieved from Firebase and shown to the user. After selection, a dog selection popup appeared. Selected dogs were correctly assigned to the chosen pet store,

				7. The selected dogs are now linked to the selected pet store.		and their association was saved and displayed successfully in the UI.
2	TC-011	Call the assigned pet store from the "My Pet Store" section.	▪ User is logged in. ▪ A pet store is selected and displayed in the "My Pet Store" section. ▪ A valid phone number is saved in Firebase for the selected store.	1. Navigate to the "My Pet Store" section. 2. Tap the "Order Now!" button.	The phone app opens and initiates a call to the pet store's phone number stored in the database.	Tapping the "Order Now!" button successfully triggered a phone call to the pet store's number as stored in Firebase. The correct phone number was used, and the device dialer was launched.
3	TC-012	Filter articles by their tags and by their ages	▪ User is logged in ▪ At least one article exists	1. Open the app 2. Navigate to the "Filter Articles" section 3. View list of filtered articles	A list of filtered articles appears. Labels of the articles match the chosen filter tags.	The functionality works as expected. The card view displays only the chosen filtered by tags articles.
3	TC-013	Open a full article from the suggestion list	▪ User is logged in ▪ At least one article is displayed on screen	1. Tap on an article from the suggested list	Full article opens in a readable format with title, content, and images	It works as expected. When you press on the card it opens a WebView of the article that was chosen.
4	TC-015	User registration with valid credentials	▪ User is not logged in ▪ Internet connection is available	1. Open the app 2. Tap "Register" 3. Fill in username, email, and password 4. Tap "Submit"	User account is created successfully and user is redirected to the home screen	The functionality works as expected. The account is created successfully and the user automatically moved to the home screen.
4	TC-016	Login with incorrect password	▪ A user account already exists in the database	1. Open the app 2. Tap "Login" 3. Enter valid email and an incorrect password 4. Tap "Submit"	An error message such as "Invalid credentials" is displayed and login is prevented	As expected we got the error message and the login is prevented.

4	TC-017	Add a new dog profile	User is logged in	1. Navigate to "My Dogs" section 2. Tap "Add Dog" 3. Fill in required details (name, age, breed, weight, etc.) 4. Tap "Save"	New dog profile is added and appears in the list of user's dogs	New dog profile is added and appears in the list of user's dogs and
4	TC-018	Edit dog details (e.g., age, name, weight)	- User is logged in - At least one dog profile exists	1. Navigate to "My Dogs" 2. Select an existing dog 3. Tap "Edit" 4. Change the dog's name or weight 5. Tap "Save"	Updated information is saved and visible in the dog profile	Updated dog information is visible in the dog profile.
4	TC-019	Delete a dog profile	- User is logged in - At least one dog profile exists	1. Go to "My Dogs" 2. Select a dog profile 3. Tap "Delete" and confirm	The dog profile is removed from the list	The dog profile is no longer appears in the list of the user's dogs.
4	TC-020	Logout and re-login to verify session persistence	User is logged in	1. Tap "Logout" 2. Close the app 3. Re-open the app and login again with same credentials	User logs in successfully and sees previous data	As expected the user was successfully logged out and then successfully sign in again and sees all of the previous data
